

**RADIALLY EXPANSIBLE VESSEL SCAFFOLD  
HAVING MODIFIED RADIOCAPACITY**

**ABSTRACT OF THE DISCLOSURE**

The present invention provides improved prostheses and methods for their  
5 endolumenal placement within body lumens, particularly blood vessels. In one embodiment,  
the prosthesis of the present invention comprises a plurality of radially expansible rings  
having, a plurality of beams connecting axially remote points on adjacent rings, and a  
plurality of expansion joints connecting axially proximate points on adjacent rings. The  
beams maintain the remote points at a fixed distance when the prosthesis is radially expanded  
10 and the expansion joints allow for relative movement of the proximate points during delivery  
of the prosthesis. The combination of the beams and expansion joints minimizes the risk of  
injury to the body lumen during delivery of the prosthesis to a target site and provides  
improved tracking capabilities.
